LoopLunch

Office lunch subscriptions | Decision brief | 13 October 2026

Scenario notice. This document is entirely synthetic and intended for testing research and simulation software. The evidence, quotes and forecasts below are invented; they do not describe a real investment opportunity.

01 The opportunity and decision

LoopLunch proposes prepaid weekday lunches delivered in one batch to a single office building in Singapore. Employees choose between two menus, order by 5 p.m. the previous day, and collect lunch from a shared lobby. The value proposition is predictable delivery and less time spent ordering.

Founder **Maya Tan** must decide by **23 October 2026** whether to launch a six-week pilot from 2 November to 11 December. She has **S$10,000** available and will tolerate a maximum pilot loss of **S$3,000**. Options are S$12 per meal, S$14 per meal, or postponement until more customers commit.

02 People, organizations and incentives

Stakeholder	Relationship and position
Maya Tan LoopLunch founder	Negotiates with the kitchen and office buyer. Prefers S$12 to encourage trial, but cannot fund recurring losses.
Daniel Koh LoopLunch operations lead	Reports to Maya. Prefers S$14 and one delivery location. Wants a firm daily order cap to protect service quality.
Aisha Lim Office manager, HarborWorks	Can grant lobby access and promote the offer to 240 employees. Cannot guarantee orders or subsidize meals. Wants arrival before 12:15 p.m.
Ravi Menon Owner, FreshBatch Kitchen	Would supply LoopLunch. Requires at least 30 paid meals per weekday and weekly advance payment; capacity is 70 meals daily.

03 Early signals inside the fictional scenario

A voluntary survey of 60 HarborWorks employees found that 36 would consider S$12 and 21 would consider S$14. These answers are stated intentions, not reservations; the sample may favor enthusiastic staff. Typical weekday attendance is assumed to be 120 employees.

A one-day trial sold 30 meals at S$12. Twenty-six arrived before 12:15 p.m.; four arrived late. Eighteen buyers said they would order again. No repeat purchase was measured. Maya calls the demand promising; Aisha says delivery reliability must improve before she promotes a longer pilot.

Pilot economics & tensions

Synthetic assumptions | All amounts in Singapore dollars (S$)

04 Unit economics and demand scenarios

Budget assumes 30 service days. Each meal costs S$7.00 for food and packaging, S$1.00 for batch delivery and S$0.50 for payment fees and service recovery: **S$8.50 variable cost**. Fixed operating cost is **S$90 per service day**, plus **S$1,200 one-time setup**. These are planning assumptions, not supplier invoices.

Price / demand assumption	S$12 option	S$14 option
Paid meals per service day	45	32
Contribution per meal	S$3.50	S$5.50
Six-week revenue	S$16,200	S$13,440
Six-week variable cost	S$11,475	S$8,160
Operating result after fixed cost and setup	**S$825 surplus**	**S$1,380 surplus**
Break-even daily orders, including setup	38 meals	24 meals*

*Break-even rounds up (S$90 + S$1,200 / 30) divided by contribution per meal. The kitchen minimum makes 30 meals the practical floor even at S$14. Founder salary, taxes and financing costs are excluded; these results are not full accounting profit.

05 Risks that could change the decision

Demand: The price scenarios are independent forecasts, not measured conversion rates. At 25 customer orders daily, LoopLunch must still pay the kitchen for 30 meals. Assuming delivery and fees apply only to the 25 delivered meals, the pilot loses S$2,325 at S$12 or S$825 at S$14 after fixed cost and setup.

Supplier shock: If food and packaging rise by S$1 per paid meal, the base-case result falls to a S$525 loss at S$12 and a S$420 surplus at S$14. Ravi will only hold the initial quote for the six-week pilot.

Trust and cash: Late meals could reduce repeat orders. Weekly supplier prepayment creates cash exposure if customers cancel. Refund rules, dietary handling and a backup delivery arrangement remain unresolved; no contract has been signed.

06 What the simulation should investigate

Compare both prices and postponement through the perspectives of Maya, Daniel, Aisha and Ravi. Explore whether they can agree on minimum preorders, delivery commitments and a loss limit. Test lower demand, a supplier price increase and recurring delivery delays. Identify what new evidence would reverse each stakeholder's position.

Proposed pilot gates: Start only with at least 30 prepaid daily orders and a written delivery agreement. Review after 10 service days. Target at least 95% on-time delivery and 60% actual repeat purchase among first-week buyers. Pause new service days if projected total pilot loss exceeds S$3,000. These gates are proposals for negotiation, not proven success criteria.
